DIGITAL ASSET WHITE PAPER

ProsperityCoins White Paper

A fair-mint airdrop experiment designed around simple participation, ecosystem access, and future utility.

SECTION 01

Introduction

ProsperityCoins, ticker symbol $PC, was created by a developer who goes by SatoshiChild (@SatoshiChildX on X.com). In its simplest form, ProsperityCoins is a financial experiment that aims to become one of the largest airdrops and distributions of a digital asset ever created. It is designed to give participants free tokens for simply participating in the ecosystem while also using a simpler and more fair distribution system compared to many other coins.

Fair Mint
SIMPLE PARTICIPATION

EVM
WALLET BASED ACCESS

Proof-of-work coins distribute coins to miners. Proof-of-stake coins distribute coins to stakers. ProsperityCoins distributes tokens to minters. Proof-of-work requires an individual to understand how to mine, while proof-of-stake is much simpler to participate in, although most APYs are relatively low. With ProsperityCoins, a user simply needs to have an EVM wallet and perform a mint transaction through the website.

ProsperityCoins is designed around simple participation: connect an EVM wallet, mint points, and take part in the distribution.

SECTION 02

The Airdrop Explained

Once the ProsperityCoins smart contract goes live and minting begins, users will be able to mint points throughout a 30-day period. A total of 100,000,000 tokens will be distributed to all point holders.

1

Minting Opens

Users connect an EVM wallet and perform a mint transaction through the website.

2

Points Accumulate

Participants mint points during the 30-day distribution window.

3

Pool Share Is Measured

Each participant's token amount is determined by their percentage share of the points pool.

4

Tokens Are Distributed

100,000,000 tokens are distributed to all eligible point holders.

The amount of tokens each participant receives is determined by their percentage share of the total points pool. For example, if a participant holds 2.5% of the overall generated points, that participant would receive 2,500,000 tokens. The system is designed to give minters a reasonable time period to earn points while preventing the downside of creating a forever-mint token.

SECTION 03

The Vision for the Future

Once the 30-day window ends, minting stops, and ProsperityCoins begins trading on centralized exchanges, the real work begins. The plan is simple: continue building useful applications that give ProsperityCoins actual utility and value.

One major goal is to attempt to transition ProsperityCoins from an ERC-20 token into a fully fledged layer-one blockchain that is also day-one quantum secure.

Utility First

The project intends to keep building useful applications that support the ProsperityCoins ecosystem.

Layer-One Ambition

A major future goal is to attempt a transition from an ERC-20 token to a full layer-one blockchain.

Quantum-Secure Goal

The future chain goal includes day-one quantum-secure architecture.

Exchange Phase

After the minting window ends, the focus shifts toward centralized exchange trading and continued development.

SECTION 04

The Launchpad

ProsperityPad.com is a launchpad platform built by the ProsperityCoins team to raise capital for projects within the ProsperityCoins ecosystem.

What makes the platform unique is that it allows deposits from multiple coins into a presale, instead of limiting users to only one or two mainnet coins. To mint ProsperityCoins, a user must be a registered user of the launchpad.

Launchpad Website

ProsperityPad.com

Purpose

Raise capital for projects within the ProsperityCoins ecosystem.

Presale Access

Users may have the option to deposit multiple different coins into presales.

Mint Requirement

Users must be registered on the launchpad to mint ProsperityCoins.
